

## Lab Exercise 16– Terraform Variables with Command Line Arguments

### Objective:

Learn how to pass values to Terraform variables using command line arguments.

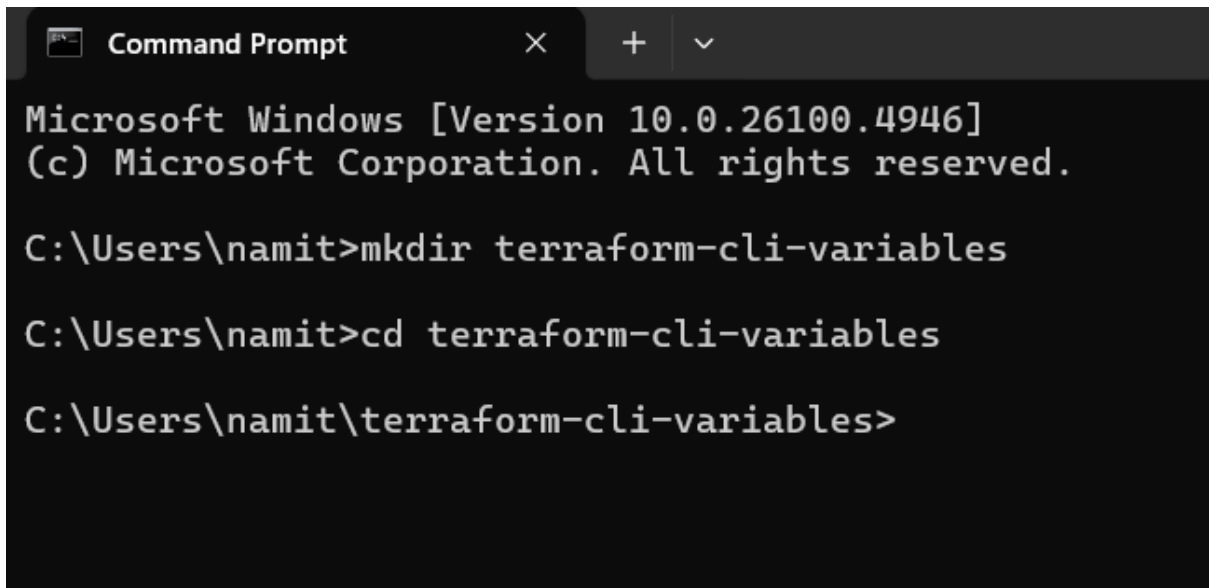

### Prerequisites:

- Terraform installed on your machine.
- Basic knowledge of Terraform variables.

### Steps:

#### 1. Create a Terraform Directory:

```
mkdir terraform-cli-variables  
cd terraform-cli-variables
```

```
Command Prompt  
Microsoft Windows [Version 10.0.26100.4946]  
(c) Microsoft Corporation. All rights reserved.  
  
C:\Users\namit>mkdir terraform-cli-variables  
  
C:\Users\namit>cd terraform-cli-variables  
  
C:\Users\namit\terraform-cli-variables>
```

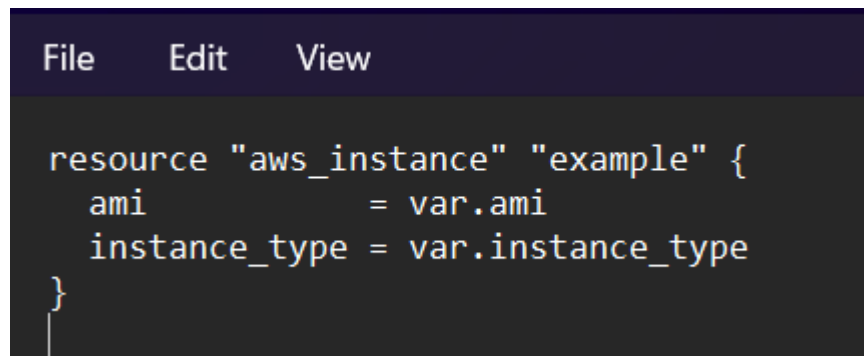

#### 2. Create Terraform Configuration Files:

- Create a file named main.tf:

# instance.tf

```
resource "aws_instance" "example" {  
  ami      = var.ami  
  instance_type = var.instance_type  
}
```

- Create a file named variables.tf:

A screenshot of a code editor with a dark theme. The editor has a menu bar at the top with 'File', 'Edit', and 'View'. The main area shows the Terraform resource definition for an AWS instance, identical to the one in the previous block.

```
File    Edit    View  
  
resource "aws_instance" "example" {  
  ami      = var.ami  
  instance_type = var.instance_type  
}
```

# variables.tf

```
variable "ami" {  
  description = "AMI ID"  
  default    = "ami-08718895af4dfa033"  
}  
  
variable "instance_type" {  
  description = "EC2 Instance Type"  
  default    = "t2.micro"  
}
```

```
File Edit View

variable "ami" {
  description = "AMI ID"
  default     = "ami-08718895af4dfa033"
}

variable "instance_type" {
  description = "EC2 Instance Type"
  default     = "t3.micro"
}
```

### 3. Use Command Line Arguments:

- Open a terminal and navigate to your Terraform project directory.
- Run the terraform init command:

#### terraform init

```
C:\Users\namit\terraform-cli-variables>terraform init
Initializing the backend...
Initializing provider plugins...
- Finding latest version of hashicorp/aws...
- Installing hashicorp/aws v6.13.0...
- Installed hashicorp/aws v6.13.0 (signed by HashiCorp)
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.

C:\Users\namit\terraform-cli-variables>
```

Run the terraform apply command with command line arguments to set variable values:

```
terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"
```

- Adjust the values based on your preferences.

```
C:\Users\namit\terraform-cli-variables>terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# aws_instance.example will be created
+ resource "aws_instance" "example" {
  + ami                    = "ami-0522ab6e1ddcc7055"
  + arn                   = (known after apply)
  + associate_public_ip_address = (known after apply)
  + availability_zone      = (known after apply)
  + disable_api_stop       = (known after apply)
  + disable_api_termination = (known after apply)
  + ebs_optimized          = (known after apply)
  + enable_primary_ipv6    = (known after apply)
  + force_destroy          = false
  + get_password_data      = false
  + host_id                = (known after apply)
  + host_resource_group_arn = (known after apply)
  + iam_instance_profile   = (known after apply)
  + id                    = (known after apply)
  + instance_initiated_shutdown_behavior = (known after apply)
  + instance_lifecycle     = (known after apply)
  + instance_state         = (known after apply)
  + instance_type          = "t3.micro"
  + ipv6_address_count     = (known after apply)
  + ipv6_addresses        = (known after apply)
  + key_name               = (known after apply)
  + monitoring             = (known after apply)
  + outpost_arn            = (known after apply)
  + password_data          = (known after apply)
  + placement_group        = (known after apply)
  + placement_group_id     = (known after apply)
  + placement_partition_number = (known after apply)
  + primary_network_interface_id = (known after apply)
  + private_dns            = (known after apply)
  + private_ip             = (known after apply)
  + public_dns             = (known after apply)
  + public_ip              = (known after apply)
}
```

```
Command Prompt
+ source_dest_check = true
+ spot_instance_request_id = (known after apply)
+ subnet_id = (known after apply)
+ tags_all = (known after apply)
+ tenancy = (known after apply)
+ user_data_base64 = (known after apply)
+ user_data_replace_on_change = false
+ vpc_security_group_ids = (known after apply)

+ capacity_reservation_specification (known after apply)

+ cpu_options (known after apply)

+ ebs_block_device (known after apply)

+ enclave_options (known after apply)

+ ephemeral_block_device (known after apply)

+ instance_market_options (known after apply)

+ maintenance_options (known after apply)

+ metadata_options (known after apply)

+ network_interface (known after apply)

+ primary_network_interface (known after apply)

+ private_dns_name_options (known after apply)

+ root_block_device (known after apply)
}

Plan: 1 to add, 0 to change, 0 to destroy.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly
C:\Users\namit\terraform-cli-variables>
```

## 4. Test and Verify:

- Observe how the command line arguments dynamically set the variable values during the apply process.
- Access the AWS Management Console or use the AWS CLI to verify the creation of resources in the specified region.

Amazon Machine Image (AMI)

Amazon Linux 2023 kernel-6.1 AMI  
ami-0b982602dbb32c5bd (64-bit (x86), uefi-preferred) / ami-0aadd5624e6e34c64 (64-bit (Arm), uefi)  
Virtualization: hvm    ENA enabled: true    Root device type: ebs

Description

Amazon Linux 2023 (kernel-6.1) is a modern, general purpose Linux-based OS that comes with 5 years of long term support. It is optimized for AWS and designed to provide a secure, stable and high-performance execution environment to develop and run your cloud applications.

Amazon Linux 2023 AMI 2023.8.20250908.0 x86\_64 HVM kernel-6.1

Architecture	Boot mode	AMI ID	Publish Date	Username	
64-bit (x86)	uefi-preferred	ami-0b982602dbb32c5bd	2025-09-06	ec2-user	<div>Verified provider</div>

## 5. Clean Up:

After testing, you can clean up resources:

```
terraform destroy
```

Confirm the destruction by typing yes.

```
Command Prompt

- private_dns_name_options {
  - enable_resource_name_dns_a_record    = false -> null
  - enable_resource_name_dns_aaaa_record = false -> null
  - hostname_type                        = "ip-name" -> null
}

- root_block_device {
  - delete_on_termination = true -> null
  - device_name           = "/dev/sda1" -> null
  - encrypted             = false -> null
  - iops                  = 100 -> null
  - tags                  = {} -> null
  - throughput            = 0 -> null
  - volume_id             = "vol-0eb840277f1384c9d" -> null
  - volume_size           = 8 -> null
  - volume_type           = "gp2" -> null
  # (1 unchanged attribute hidden)
}
}

Plan: 0 to add, 0 to change, 1 to destroy.

Do you really want to destroy all resources?
Terraform will destroy all your managed infrastructure, as shown above.
There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes

aws_instance.My-instance: Destroying... [id=i-024d832075908811a]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 00m10s elapsed]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 00m20s elapsed]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 00m30s elapsed]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 00m40s elapsed]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 00m50s elapsed]
aws_instance.My-instance: Still destroying... [id=i-024d832075908811a, 01m00s elapsed]
aws_instance.My-instance: Destruction complete after 1m1s

Destroy complete! Resources: 1 destroyed.

C:\Users\namit\Terraform-Demo>
```

## 6. Conclusion:

This lab exercise demonstrates how to use command line arguments to set variable values dynamically during the terraform apply process. It allows you to customize your Terraform deployments without modifying the configuration files directly. Experiment with different variable values and observe how command line arguments impact the infrastructure provisioning process.
